Nifty 50 Post-Market Tally - 2026-05-27

Nifty 50 Post-Market Tally

Analysis Date: 2026-05-27

Tally Time: 2026-05-27 17:00 IST

Morning Report Reviewed: `reports/2026-05-27/morning-report.md`

1. Actual Market Snapshot

Field	Morning Reference / Forecast	Actual Result	Tally
Open	23,880.35	23,880.35	Correct
High	Not used in morning view	23,983.20	Post-market actual
Low	Not used in morning view	23,858.25	Post-market actual
Close	Not used in morning view	23,907.15	Post-market actual
Close vs Open	Near open, mild downside risk	Close above open by 26.80 pts	Near-open call hit; downside lean did not play out
Actual Day Range	Expected broad range: 23,516 - 24,244	124.95 pts	Contained, but forecast range too wide
India VIX	Prior close 16.13	Closed near 14.98	VIX cooling view confirmed

Tally Confidence: 86%

2. Morning Thesis vs Actual

Morning View	Actual Market Behaviour	Score
Leading case: Sideways 44%	Nifty closed only 26.80 pts above open and 6.55 pts below previous close	88/100
Downside probability: 31%	Breakdown below 23,800 did not happen	62/100
Upside probability: 25%	No breakout above 24,050; upside capped below 24,000	72/100
Range-selling day with conditional breakdown risk	Range-selling worked; conditional breakdown did not trigger	82/100

Section Score: 78/100

3. Key Levels Tally

Level / Zone	Morning Logic	Actual Test	Result
23,800 breakdown	Bearish trigger	Low 23,858.25, no break	Correct invalidation
23,836 - 23,885 support	Immediate support cluster	Low formed inside this zone	Strong hit
23,938 - 24,000 resistance	Immediate resistance / CPR supply	High 23,983.20, rejected below 24,000	Strong hit
24,040 - 24,050 breakout	Bullish confirmation	Not reached	Correct filter
23,913 - 23,963 mean reversion	Sideways target	Close 23,907.15, near target band	Good hit

Section Score: 86/100

4. Probability Calibration

Morning probabilities:

- Upside: 25%
- Downside: 31%
- Sideways: 44%

Actual classification:

- Close finished above open, but by only 0.11%.
- Close remained within the morning sideways definition of roughly +/-0.4% to 0.5% from open.
- Therefore, the correct outcome bucket is **Sideways / near-open**, not a clean directional upside day.

Calibration result:

- Leading scenario hit: Yes.
- Directional nuance: Mild miss, because the report leaned slightly downside while actual closed slightly above open.
- Confidence was conservative: 66% overall vs stronger realized fit.

Section Score: 82/100

5. Trader-Specific Review

Option Non-Directional Seller

Morning view said range-selling was suitable only after 30-45 minutes if 23,800 - 24,050 held. That was the best trader category for the day because both sides stayed contained and VIX cooled.

Score: 75/100

Learning: Future reports should give a cleaner SL-based intraday structure instead of hedge-first language.

Option Directional Seller

Morning view preferred call-side selling after rejection near CPR/24,000. That broadly worked because 24,000 was not reclaimed, but conviction should have stayed moderate because the index did not trend down.

Score: 62/100

Learning: Directional sellers needed quicker profit booking; trend follow-through was absent.

Option Buyer

Morning view warned against blind buying and required 23,800 breakdown or 24,050 breakout. Neither happened, so the avoid/conditional stance was correct.

Score: 52/100

Learning: Buyer section should explicitly say "no trade if trigger does not fire."

Future Intraday Trader

Morning view said avoid the middle zone and trade only outside 23,835/23,800 or 24,050. Since no clean trigger occurred, the correct behaviour was mostly no-trade or scalp-only.

Score: 70/100

Learning: Future reports should mark "no-trade zone" more visually and prominently.

Trader Plan Section Score: 65/100

6. Risk / Invalidation Review

Risk Item	Morning Trigger	Actual	Result
Bullish invalidation	Sustain above 24,050	Not triggered	Correct
Bearish acceleration	Sustain below 23,800	Not triggered	Correct
VIX spike risk	VIX above 17.2	VIX cooled to 14.98	Risk did not materialize
Watch window	9:20 - 10:15 acceptance/rejection	Market stayed contained	Useful
Holiday/expiry caution	Avoid aggressive late trades	Valid due next-day holiday/expiry context	Useful

Section Score: 80/100

7. What Worked

- The sideways/range-selling thesis was correct.
- 23,800 as breakdown trigger worked well because price never accepted below it.
- 24,000/24,050 as upside filter worked well because upside failed below that zone.
- VIX cooling reduced trend risk and supported option premium decay.
- The warning against blind option buying was appropriate.

8. What Did Not Work

- Expected day range was statistically correct but too wide for actionable intraday use.
- Direction bias was slightly too bearish; actual close was near open but above it.
- Markov overlay was only a proxy and should not be counted as a strong input.
- Trader-specific language used hedge-first wording, which does not match the preferred intraday SL-based style.
- Visual density of the report needs improvement for faster trader reading.

9. Auto-Healing / Calibration Update

Allowed update:

- Record one successful sideways scenario.
- Record range estimate as "contained but too wide."
- Reduce future practical/actionable range confidence when VIX formula produces very broad bands but opening structure is tight.
- Add preference: intraday trader guidance should default to SL/invalidation, not hedge-first plans.

Not allowed:

- Do not rewrite the core model from one data point.
- Do not increase confidence aggressively after one good hit.
- Do not remove risk warnings from naked option selling or buying.

Calibration Action: Update learning scorecard and calibration file only. No core probability-weight change from a single sample.

10. Final Tally

Category	Score
Header / data integrity	92
Market summary	82
Key levels	86
Expected range	65
Close vs open bias	70
Probability model	82
Scenario mapping	84
Trader-specific guidance	65
Risk invalidations	80
Overall Tally Score	78

Bottom line: The 9:20 AM report was directionally cautious but structurally useful; its best call was the sideways/range-selling thesis, while the biggest improvement area is making the actionable range and trader execution plan cleaner and more SL-based.
