Nifty 50 Intraday Desk Report

Analysis Date: 2026-06-02

Mode: LIVE

Generated At: 2026-06-02 09:20 IST

Reference Prices:

Previous Close: 23382.60

Today's Open: 23229.15

VIX Risk Envelope: 22866 - 23592

VIX Envelope Confidence: 64%

Expected Day Range: 23120 - 23530

Expected Range Confidence: 57%

Expected High Zone: 23470 - 23530

Expected Low Zone: 23120 - 23220

Tail Expansion Zones: Upside 23560 - 23625 / Downside 22950 - 23060

Range Precision Confidence: 54%

Opening Execution Map:

No-Trade / Chop Zone: 23245 - 23380

Long Trigger: Above 23405, SL 23345, targets 23480 / 23530

Short Trigger: Below 23190, SL 23255, targets 23120 / 23030

Execution Confidence: 56%

Close vs Open Direction:

Expected Direction: Close below open

Direction Confidence: 55%

Overall Report Confidence: 58%

1. Market Summary

NSE status is open for the session: the NSE Clearing June F&O settlement schedule lists 02-Jun-2026 as a valid trade date.

Nifty opened with a moderate gap-down at 23229.15, below the previous day low, below S1, and far below the wide CPR zone.

India VIX previous close was 16.54, keeping intraday expansion risk elevated rather than calm.

The base behaviour is sell-on-rise with possible gap-down bounce attempts; failure below 23190 can extend toward 23120/23060.

Inputs were verified from exchange/news sources: previous OHLC, 09:15 open, VIX close, GIFT Nifty, FII/DII and macro cues. ([archive.nseclearing.in](https://www.archive.nseclearing.in/content/circulars/CMPT74072.pdf))

Section Confidence: 62%

2. Key Levels

| Level Type | Level | Interpretation | Confidence |

|---|---:|---|---:|

| Strong Resistance | 23545 - 23625 | CPR upper edge to R1; major supply band if gap-fill extends | 64% |

| Immediate Resistance | 23358 - 23437 | Previous low to CPR lower edge; first rejection zone | 66% |

| Strong Support | 23000 - 23120 | Round-number support plus S2 zone; downside tail defence | 59% |

| Immediate Support | 23200 - 23250 | Open/S1 area; failure below this confirms weak acceptance | 63% |

| Pivot | 23491.42 | Below pivot, intraday bias remains supply-led | 68% |

| CPR Zone (TC to BC) | 23437.01 - 23545.83 | Wide CPR; open far below it, favouring bearish-to-reversal volatility | 69% |

| Previous Day High | 23733.70 | Far resistance; unlikely unless strong short-covering appears | 61% |

| Previous Day Low | 23357.95 | Key reclaim level for any recovery attempt | 70% |

| Previous Day Close | 23382.60 | Gap-fill reference; above this, bearish pressure reduces | 67% |

| Breakout Level | 23550 | Acceptance above CPR upper edge shifts day to short-covering | 55% |

| Breakdown Level | 23190 | Below open-support shelf; activates 23120/23060 downside | 58% |

| VIX Risk Envelope | 22866 - 23592 | Statistical volatility envelope only, not the tradable expected range | 64% |

| Primary Expected Day Range | 23120 - 23530 | Practical forecast range from expected low to expected high zones | 57% |

| Expected High Zone | 23470 - 23530 | Most likely day-high area if bounce reaches pivot/CPR supply | 54% |

| Expected Low Zone | 23120 - 23220 | Most likely day-low area if 23200 is defended or briefly flushed | 54% |

| Tail Expansion Zones | Upside 23560 - 23625 / Downside 22950 - 23060 | Extension only if primary range fails | 48% |

| R1 | 23624.88 | Upper tail target; aligns with upside expansion zone | 68% |

| R2 | 23867.17 | Low-probability trend extension resistance | 62% |

| S1 | 23249.13 | Open is below/near S1; reclaim is needed for bounce credibility | 70% |

| S2 | 23115.67 | Primary downside magnet if 23200 fails | 68% |

Section Confidence: 64%

3. Probability Model

From current day open of 23229.15:

Upside Probability: 34%

Downside Probability: 46%

Sideways Probability: 20%

Total: 100%

Section Confidence: 57%

Leading scenario: Nifty opened below the prior low and below S1 after a weak prior-session candle, so the first bias is supply-on-rise rather than clean buy-on-dip.

The 23200-23250 zone is the tactical battleground; holding it can create a gap-down bounce, but failure below 23190 should invite faster expiry-day selling.

Call-side resistance is heavy from 23500 to 23900, so even a bounce toward 23470-23530 is expected to face supply unless VIX cools sharply.

DII buying provides a liquidity cushion, but FII selling, crude near USD 94-95, USD/INR near 95, and event risk keep direction confidence modest. ([upstox.com](https://upstox.com/news/market-news/trading/trade-setup-for-june-2-can-nifty-50-hold-23-00-0-support-on-expiry-day/article-194617/))

4. Factor Scoring Table

| Factor | Observation | Bias | Weight | Impact | Confidence |

|---|---|---|---|---|---|

| Price Action & Gap Context | Previous day was a large red candle; today opened at 23229.15, below previous low 23357.95 and below S1 23249.13 | Bearish, with oversold bounce risk | 35% | -18 / 35 | 64% |

| India VIX / Volatility | India VIX previous close 16.54, up from 16.19; elevated enough for expiry whipsaws | Volatile / bearish | 20% | -8 / 20 | 62% |

| Derivatives Logic | Weekly expiry; call OI concentration at 23500-23900; downside put defence cited near 23300, now threatened by open below it | Bearish below 23300; reversal if reclaimed | 20% | -9 / 20 | 54% |

| Global & Macro Cues | US indices closed at records, but Asian cues were mixed/weak; Brent around \$94.35 and USD/INR near 95 keep India-specific risk fragile | Mixed but fragile | 15% | -4 / 15 | 58% |

| Institutional Flow / Liquidity | FIIs sold ■3,911.68 crore; DIIs bought ■5,109.13 crore, cushioning but not fully reversing FII pressure | Slightly bearish | 10% | -3 / 10 | 65% |

| Markov Regime Overlay | Four-session weakness plus close near prior-day low indicates bear-persistence regime, but gap-down opens often create mean-reversion attempts | Calibration layer | Non-voting or bounded | Lowers directional confidence | 52% |

Section Confidence: 59%

5. Scenario Mapping

Bullish Case (34%)

Price must sustain above: 23380 first, then 23405-23437.

VIX behaviour: VIX should cool below 16.2 and avoid fresh spikes above 16.8.

Breakout confirmation: 15-minute acceptance above 23405 with failed breakdown below S1.

Upside targets: 23480, 23530, then 23560-23625 tail.

Confidence: 52%

Bearish Case (46%)

Price must fail below: 23245-23250, then break 23190.

VIX behaviour: VIX holding firm or rising back toward 16.8+ supports expansion.

Breakdown confirmation: Spot below 23190 with failed reclaim of 23250 after the first attempt.

Downside targets: 23120, 23060, then 23000/22950 tail.

Confidence: 58%

Sideways Case (20%)

Range to hold: 23200-23470.

Option writer defence zone: 23300 put defence versus 23500 call resistance.

Confirming behaviour: Failed breakouts on both sides with VIX compression and low follow-through after 10:15.

Mean reversion target: 23350-23400.

Confidence: 45%

Section Confidence: 56%

6. Assumptions Made

Missing Data Assumptions

- The report uses the current-day 09:15 open/reference price only; no final close, final high/low, or later intraday path is used.
- US 10-year yield is taken as the latest available prior-session close near 4.448%.
- USD/INR is treated as near 95 based on early-session/previous-close reporting.
- Current live option-chain PCR was not reliably available from a primary source at the 09:20 boundary.

Simulated Derivatives Assumptions

- Confirmed from pre-market derivatives commentary: call-side OI concentration is high from 23500 to 23900.
- Put defence is assumed around 23300/23200/23000, but because spot opened below 23300, that defence is treated as vulnerable.
- Max pain is simulated around 23300-23400, not confirmed.
- Expiry-day gamma risk is high; SL/invalidation must be respected because slippage can exceed planned risk.

Macro Assumptions

- US record closes are supportive for global technology sentiment, but India-specific macro remains fragile due to crude, rupee weakness and FII outflows.
- Brent around \$94-95 is a material but not panic-level macro drag for India.
- RBI policy/event risk later in the week may suppress aggressive risk-taking.

Markov/Quant Assumptions

- A qualitative regime overlay is used because a full local historical transition matrix was not available inside this run.
- The regime is classified as bear-persistence with gap-down mean-reversion risk.
- The overlay reduces confidence rather than overriding CPR, VIX, derivatives, and macro evidence.

Section Confidence: 55%

7. Invalidations / Risk Factors

| Risk Factor | Trigger | Consequence | Primary View Invalidated | Confidence |

|---|---|---|---|---|

| Price invalidation | Sustained 15-minute acceptance above 23550 | Bearish sell-on-rise view shifts to short-covering toward R1 | Close below open / bearish case | 58% |

| Geopolitical/news risk | Fresh West Asia escalation, oil spike, or sudden peace headline | Can create one-way move beyond expected zones | Range forecast and execution map | 53% |

| FII selling shock | Heavy follow-through selling in index heavyweights after the first hour | Break below 23190 can extend to 23060/23000 quickly | Sideways and bullish cases | 60% |

| VIX spike | India VIX above 17 with spot below 23190 | Downside tail expansion becomes active | Primary expected range | 57% |

| Watch window | 09:20-10:15 and 13:45-15:00 on expiry day | False breakouts and rapid stop-outs likely | Early entries without confirmation | 66% |

Section Confidence: 58%

8. Trader-Specific Desk Plan

Option Non-Directional Seller

- Suitable / avoid: Avoid fresh non-directional selling until at least 10:15 unless price stabilises inside 23200-23470 and VIX cools.
- Preferred structure: Small intraday short strangle/straddle only after range confirmation; defined-risk wings preferred for smaller accounts, but primary management remains SL/invalidation-based.
- Strike or range logic: Consider call side above 23500/23600 only on rejection; put side below 23100/23000 only after S2 defence is visible.
- Entry condition: Enter only if spot repeatedly rejects both 23190 and 23470 and premiums start decaying.
- Stop/invalidation: Exit or cut the threatened side if spot accepts beyond 23550 or below 23190; do not average into expiry gamma.
- Time window: Prefer 10:15-13:30; avoid fresh size in the first 30 minutes.
- Confidence: 47%

Option Directional Seller

- Suitable / avoid: Suitable only for disciplined traders; avoid naked size due expiry-day whipsaw risk.
- Preferred side: Call selling on rise while below 23437/23500; put selling only after firm rejection of 23190.
- Strike logic: 23500/23600 CE for bearish rejection; 23100/23000 PE only if strong support confirmation appears.
- Entry condition: Sell calls near 23380-23437 rejection, or after breakdown-retest below 23190.
- Stop/invalidation: For call shorts, spot above 23480 first warning and above 23550 full invalidation; for put shorts, spot below 23190 invalidates.
- Time window: 09:45-13:45; reduce aggression after 14:15 unless trend is clean.
- Confidence: 55%

Option Buyer

- Suitable / avoid: Suitable only for trigger-based momentum; avoid buying in 23245-23380 chop.
- Calls or puts: Puts preferred below 23190; calls only above 23405 with follow-through.
- Entry condition: Buy puts on breakdown below 23190 with retest failure; buy calls only if 23405-23437 is accepted.
- Stop/invalidation: Use spot-based invalidation: puts invalid above 23255; calls invalid below 23345. Premium SL alone may be unreliable during IV shifts.
- Target logic: Put targets 23120/23060; call targets 23480/23530.
- Time window: 09:35-11:15 for first move; 13:45-14:45 only if volume expands.
- Confidence: 52%

Future Intraday Trader

- Suitable / avoid: Suitable for experienced intraday traders; avoid trades inside 23245-23380 unless scalping.
- Entry zone: Short below 23190 or on rejection from 23380-23437; long only above 23405 with acceptance.
- Stop: Short SL 23255; long SL 23345.
- Targets: Short 23120/23030; long 23480/23530.
- Timing: Let the first 15-20 minutes settle; use 5-minute close confirmation due gap-down volatility.
- Confidence: 56%

Section Confidence: 53%

9. Trading Desk Interpretation

Sell-on-rise day.

The desk should treat 23380-23437 as the first supply zone and 23470-23530 as the high-probability rejection zone unless Nifty accepts above the CPR lower/upper band with VIX cooling. The cleanest bearish trigger is below 23190; the cleanest bullish trigger is above 23405 with confirmation, not merely a tick above it. Bottom line: respect the gap-down risk, but do not chase shorts inside 23245-23380 chop without breakdown confirmation.

Section Confidence: 57%
