

Nifty 50 Post-Market Tally - 2026-06-03

Nifty 50 Evening Tally — 2026-06-03

Automation: Nifty 5 PM post-market tally

Boundary: Post-market after 17:00 IST

Market-open check: `market\_open=true`. NSE trading was confirmed by post-market Nifty 50 prints for 03 Jun 2026: Open **23,415.95**, High **23,459.65**, Low **23,151.50**, Close **23,405.60**. ([dhan.co](https://dhan.co/indices/nifty-50-share-price/))

1. Actual Post-Market Data

Item	Actual
Nifty 50 previous close	23,483.55
Nifty 50 open	23,415.95
Nifty 50 high	23,459.65
Nifty 50 low	23,151.50
Nifty 50 close	23,405.60
Actual day range	308.15 pts
Close vs open	Below open by 10.35 pts
Close vs previous close	-77.95 pts / -0.33%

Dhan's post-market page showed the exact Nifty OHLC, while Business Standard independently reported the Nifty closing at **23,405.60**, down **77.95 points**, and noted the intraday low near **23,151.50**. ([dhan.co](https://dhan.co/indices/nifty-50-share-price/))

India VIX: Closed at **16.28**, up **5.99%**, with day high **16.98** and low **14.85**. Business Standard also reported India VIX up about **6%** to **16.28**. ([dhan.co](https://dhan.co/indices/india-vix-share-price/))

Final institutional context: FIIs were net sellers of **■5,616.56 crore** and DIIs were net buyers of **■5,740.89 crore** on 03 Jun 2026 in cash provisional data. ([moneycontrol.com](https://www.moneycontrol.com/stocks/marketstats/fii_dii_activity/))

Macro/context: Brent crude was reported near **\$98.35/bbl**, USD/INR around **95.6775**, India 10-year yield around **7.025**, and HSBC India Services PMI was revised higher to **59.8** for May 2026. ([business-standard.com](https://www.business-standard.com/amp/markets/capital-market-news/benchmarks-pare-steep-losses-sensex-slides-304-points-nifty-ends-below-23-450-126060300936_1.html?isa=yes))

2. Header Forecast Audit

Forecast item	Morning forecast	Actual	Verdict
Previous close	23,483.55	23,483.55	Hit
Today's open	23,415.95	23,415.95	Hit
VIX risk envelope	23,076 - 23,756	23,151.50 - 23,459.65	Contained
Expected day range	23,190 - 23,540	23,151.50 - 23,459.65	Strict low miss, but within ±50 tolerance
Expected high zone	23,465 - 23,540	23,459.65	Miss by 5.35 pts only; precision hit
Expected low zone	23,190 - 23,285	23,151.50	Miss by 38.50 pts only; precision hit
Close vs open	Close below open	Close below open	Hit

Direction call: Correct. The close was below the open, but only by **10.35 points**, so this is a binary hit with a thin margin.

Range precision: Passed. Both high-zone and low-zone misses were within the ± 50 -point tolerance.

Range containment: Strict primary range containment failed because the actual low was below **23,190**, but the miss was tolerance-compliant.

3. Section-Wise Audit

1. Market Summary

The morning view called for a fragile range-to-downside session, with risk of breakdown below **23,380**. Actual price broke below **23,380**, sold off toward **23,151.50**, then recovered sharply into the close. This was directionally aligned with the fragile/downside warning, though the late recovery made the close-vs-open hit narrow.

Score: 82/100

2. Trader Key Levels

| Morning level | Actual behaviour | Verdict |

|---|---|---|

| Long above 23,460 | Actual high 23,459.65, effectively not triggered | Good filter |

| Short below 23,380 | Triggered clearly | Hit |

| Short targets 23,310 / 23,240 | Both achieved | Hit |

| Downside tail 23,160 - 23,095 | Actual low 23,151.50 entered tail zone | Hit |

| Chop zone 23,390 - 23,455 | Close returned into/near this zone | Useful late-session context |

The short trigger and downside targets worked well. The long trigger avoided a false long by less than one point.

Score: 88/100

3. Probability Model

Morning probabilities: Upside **28%**, Downside **38%**, Sideways **34%**.

Actual session: downside trigger and tail expansion occurred, but the close recovered to only slightly below open. The leading bearish case was the best-fitting scenario, but the final close behaved more like a bearish-to-sideways recovery day.

Score: 76/100

4. Factor Scoring Table

The report correctly weighted FII selling, oil/rupee pressure, and VIX expansion risk as fragility drivers. Actual data confirmed continued FII selling, DII absorption, Brent near \$98, USD/INR pressure, and VIX rising to 16.28.

([moneycontrol.com](https://www.moneycontrol.com/stocks/marketstats/fii_dii_activity/))

Score: 80/100

5. Scenario Mapping

- **Bearish case:** Triggered below **23,380**, achieved **23,310**, **23,240**, and touched downside tail.

- **Bullish case:** Not triggered; actual high stayed just below long trigger.

- **Sideways case:** Not the primary intraday structure, but late recovery into the chop/mean-reversion area made the close less bearish than the intraday low.

Score: 86/100

6. Assumptions Made

The morning report correctly labelled live option-chain zones as simulated and preserved uncertainty around derivatives. Macro assumptions around RBI event risk, crude, rupee, and FII pressure were directionally useful.

Score: 78/100

7. Invalidations / Risk Factors

The VIX spike warning was useful: VIX rose to **16.28**, near but below the stated **16.5 - 17** risk trigger. The geopolitical/crude risk framing was also validated by the reported Brent and West Asia context. ([business-standard.com](https://www.business-standard.com/amp/markets/capital-market-news/benchmarks-pare-steep-losses-sensex-slides-304-points-nifty-ends-below-23-450-126060300936_1.html?isa=yes))

Score: 82/100

8. Trader-Specific Desk Plan

| Trader type | Audit |

|---|---|

| Option non-directional seller | Caution was appropriate; aggressive early selling would have been risky during the breakdown. Better only after late recovery. |

| Option directional seller | Failed-rise CE selling was not the main opportunity; downside trigger logic was more useful. |

| Option buyer | Put-buying below 23,380 worked well; both listed targets were achieved. |

| Futures intraday trader | Short below 23,380 with targets 23,310 / 23,240 worked well; tail management mattered. |

Score: 82/100

9. Trading Desk Interpretation

Morning classification was **Avoid / wait-and-watch day**. That was appropriate: the session had a sharp downside break, VIX expansion, tail touch, and then a large recovery. Trigger-based traders had opportunity; blind trend chasing near lows was risky.

Score: 84/100

4. Precision and Error Metrics

| Metric | Value |

|---|---:|

| Expected high zone | 23,465 - 23,540 |

| Actual high | 23,459.65 |

| High-zone error | 5.35 pts |

| Expected low zone | 23,190 - 23,285 |

| Actual low | 23,151.50 |

| Low-zone error | 38.50 pts |

| Range precision hit | true |

| VIX envelope contained day | true |

| Strict expected range contained day | false |

| Expected range tolerance hit | true |

No `expected\_high\_miss`, `expected\_low\_miss`, or `range\_precision\_miss` tag is applied because both edge errors were within the ± 50 -point tolerance.

5. Bounded Auto-Healing Result

Processed only bounded calibration updates:

1. Update rolling direction-hit statistic: **hit**.
2. Update VIX-envelope containment statistic: **hit**.
3. Update expected high/low range-precision statistic: **hit**.
4. Add source reliability note: post-market Nifty OHLC, India VIX, and FII/DII data were available and internally consistent across public sources.
5. Apply a small **+1 confidence offset** to key-level/range-precision calibration only; do **not** rewrite core CPR, probability, derivatives, or trader-plan logic.

No core skill logic rewrite recommended.
